

* feature ^{OC}

Volume is a directory that can be shared with others.

Volume can be shared from container to container.

↳ also from host to container.

- o Volume is simply a directory inside our container.
- o Firstly, we have to declare this directory as a volume and then share volume.
- o Volume will be created in our container.
- o You can declare a directory as a volume only while creating container.
- o You can't create volume from existing container.
- o You can share one volume across number of containers.
- o Volume will not be included when you update an image.
- o You can map volume in two ways.
 - ① Container \longleftrightarrow Container
 - ② Host \longleftrightarrow Container.

Benefits of Volume

- o Decoupling Containers from storage
- o Share Volume among different containers
- o Attach Volumes to Containers
- o On deleting Containers volume does not delete.

Dockerfile

FROM ubuntu

VOLUME ["/file path"]

sharing volume.

```
#docker run -it --name container2
--privileged=true --volume-from
containername1 ubuntu /bin/bash
```

→ lab

C ← PC

[With docker file]

yum install -y docker

service docker start

touch file1 file2

vi Dockerfile

FROM ubuntu

VOLUME ["/myvolume"]

Docker build -t myimage

docker images -

docker run -it --name mycont1
myimage /bin/bash

ls

cd myvolume

touch 1 2 3 4

ls

exit

docker run -it --name mycont2

--privileged=true --volume-from mycont1

ubuntu /bin/bash

ls

cd myvolume

ls

With Command line

```

--name bang H
# docker run -it 1 container3
-v /volume2 ubuntu /bin/bash
# ls
# cd /volume2
# touch file1 file2 file3 file4
# exit
# docker run -it --name container4
--privileged=true --volume-from
container3 ubuntu /bin/bash
# ls
# cd /volume2
# ls

```

With $\xrightarrow{\text{fast}}$ Cont
 Command line

```
# pwd
```

```
/home/ee2-user
```

```
# ls
```

```
# mkdir /volumes
```

```
# docker run
```

```
# touch /volumes/filexyz
```

```
# docker run -it --name cont
```

```
-x /home/ee2-user/volumes:/rajput
```

```
--privileged=true
```

```
# ls /bin/bash
```

```
# cd /rajput
```

```
# ls
```

local m/c

Container m/c

Commands

```
# docker volume ls
```

```
# docker volume create <volumename>
```

```
# docker volume rm <volumename>
```

```
# docker volume prune
```

↳ Removes all unused volumes

```
# docker volume inspect <volumename>
```

```
# docker container inspect <volumename>
```

Lecture of

Logical ports: 0 to 65535

expose : Cont to Cont in same host

publish : Cont to outside too (like internet)

"-p includes expose"

```
# docker run -td --name techserver
-p 80:80 ubuntu. ↑
```

↑ daemon

publish/port

```
# docker port techserver
```

→ Available : ports

```
# docker exec -it techserver. /bin/bash
```

↑
Take inside Cont. with new process (attach uses old process)

Port of local machine can be changed
But not of container ???

PAGE NO.

DATE:

→ lab

```
# yum install docker -y
# service docker start
# docker run -td --name tech
  -p 80:80 ubuntu
# docker ps
# docker port techserver
# docker exec -it techserver /bin/bash
# apt-get install -y apache
# cd /var/www/html
# vim index.html
  "Hello everyone"
# exit # service apache start
```

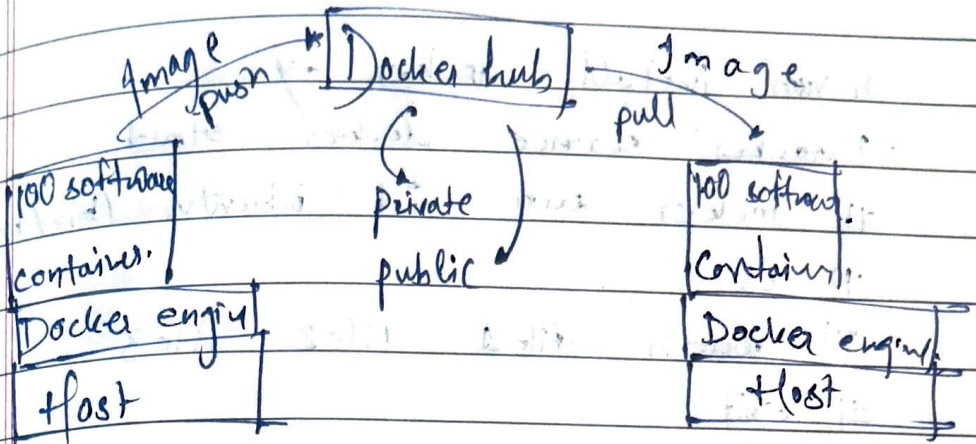

Copy IP to browser. : 80

```
# exit
# docker run -td --name jenkins
  -p 8080:8080 jenkins
# docker port jenkins.
```

Copy IP to browser : 8080

If Container is stopped or deleted
all the ports are unmapped.

Lecture 08

① stopping all running containers:

```
# docker stop $(docker ps -a -q)
```

↙ ↘
runs in loop quit

② Delete all stopped Containers:

```
# docker rm $(docker ps -a -q)
```

③ Delete all images:

```
# docker rmi -f $(docker images -q)
```

↙
forcefully

→ Lab

```
# yum install docker -y
# docker service docker start
# docker run -it ubuntu /bin/bash
# ls
# touch file1 file2 file3
# exit

# docker commit
# docker ps
# docker commit cont.name image1
# docker images
#
go to google
hub.docker.com
sign-up

# docker login
(p-username password)

# docker tag image1 technicalguttu/project1
                               (username tag)

# docker push technicalguttu/project1
```

going to another instance & starting
docker service.

```
# docker pull technicalguttu/project1
# docker images.
# docker run -it --name _____
# ls.
```

You can change image into private by
going into docker hub settings.

Then while pulling image you have
to run first "`# docker login`"
command & log in into docker hub.
